- 4.0 Specifications
- 5.0 Measurement locations
- 6.0 Conclusions
- 7.0 Recommendations

1.0 Introduction

The purpose of this measurement survey was to determine the floor vibration, AC EMI and acoustical levels in the Jack Baskin Engineering Building.

2.0 Instrumentation

The instrumentation utilized to conduct the testing is itemized below:

Spectrum Analyzer:	Data Physics ACE DP-104
Accelerometer:	Wilcoxon 731 seismic accelerometer, Serial Number 1791, 100 Volt per G.
EMI coil:	MSI Magcheck 95, 1.0 millivolt per milligauss
Microphone:	RS 33-2050

All instrumentation and the spectrum analyzer are currently calibrated with documentation in place traceable to the National Institute of Standards and Technology.

The analyzer has a low range sensitivity to -130 dB referenced to 1 volt.

3.0 Test Procedures

Data was gathered in the basement and on the 1st floor of the building.

Vibration measurements were made on the floor in three directions at the locations shown in the map below. The EMI and sound pressure measurements were made approximately four feet above the floor.

The RMS velocity measurements were first made at a bandwidth of 250 hertz. Power spectra functions of velocity are produced from the acceleration measurements by integration.

The RMS EMI measurements were performed at a bandwidth of 625 hertz. Power spectra functions of EMI in three directions were recorded on disk for later processing and plotting.

The RMS acoustic levels were measured with a calibrated microphone and the dBA and dBC levels were recorded and reported for each site.

All measurements were recorded on the internal disk of the analyzer for later processing. Measurements were taken under normal operating conditions.

In addition data was taken on the roof of building, close to the building fan units. Measurements were made in all 3 directions for the 6 fans. Figures 1 through 18 – pages 47 through 55 show the

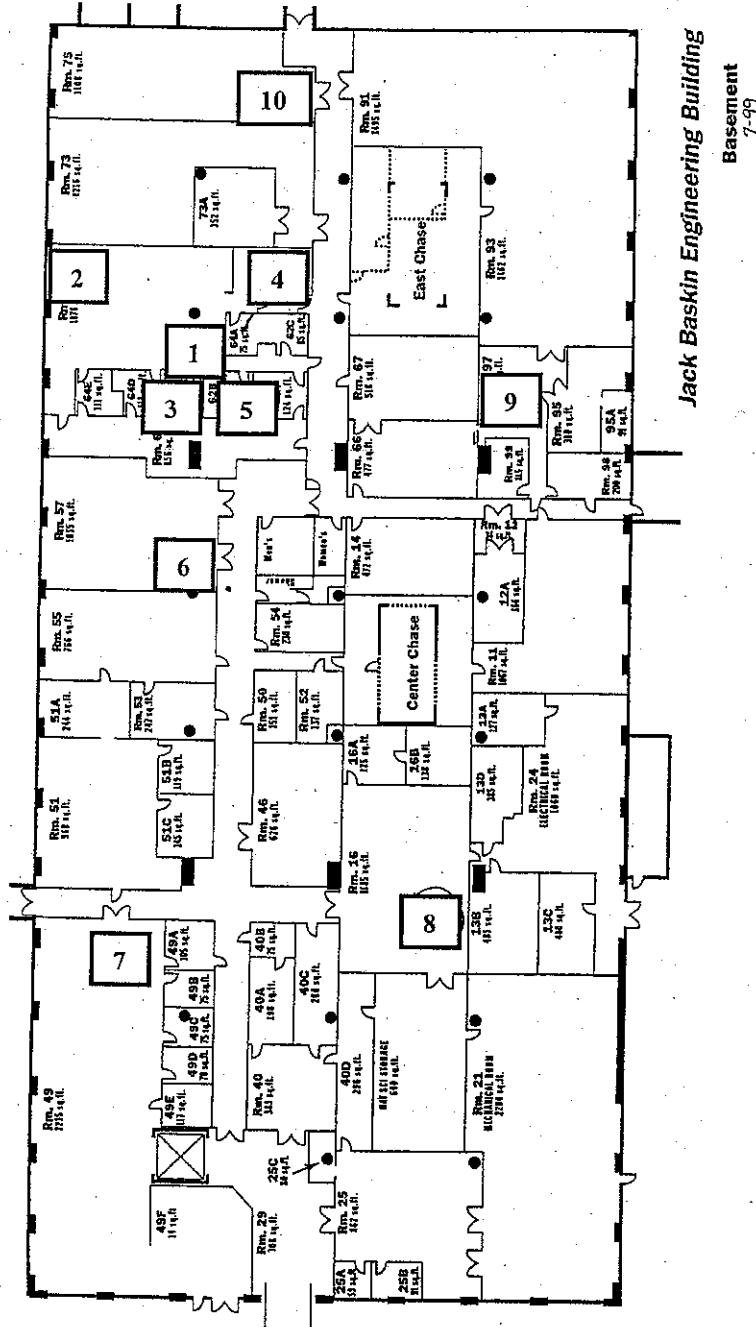

velocity spectra. The fan #fs66 has bad isolators and show velocity levels about 10 times higher than the other 5 fans, as can be seen on figures 13, 14 and 15.

4.0 Specifications

- Vibration: 2 $\mu\text{m/sec RMS}$ < 20 Hz
 6 $\mu\text{m/sec RMS}$ > 20 Hz
- EMI: 3 mGauss Peak-to-Peak at 50 and 60 Hz
- Acoustic 50 dBA > 200 Hz
 35 dBA < 200 Hz

5.0 Measurement locations

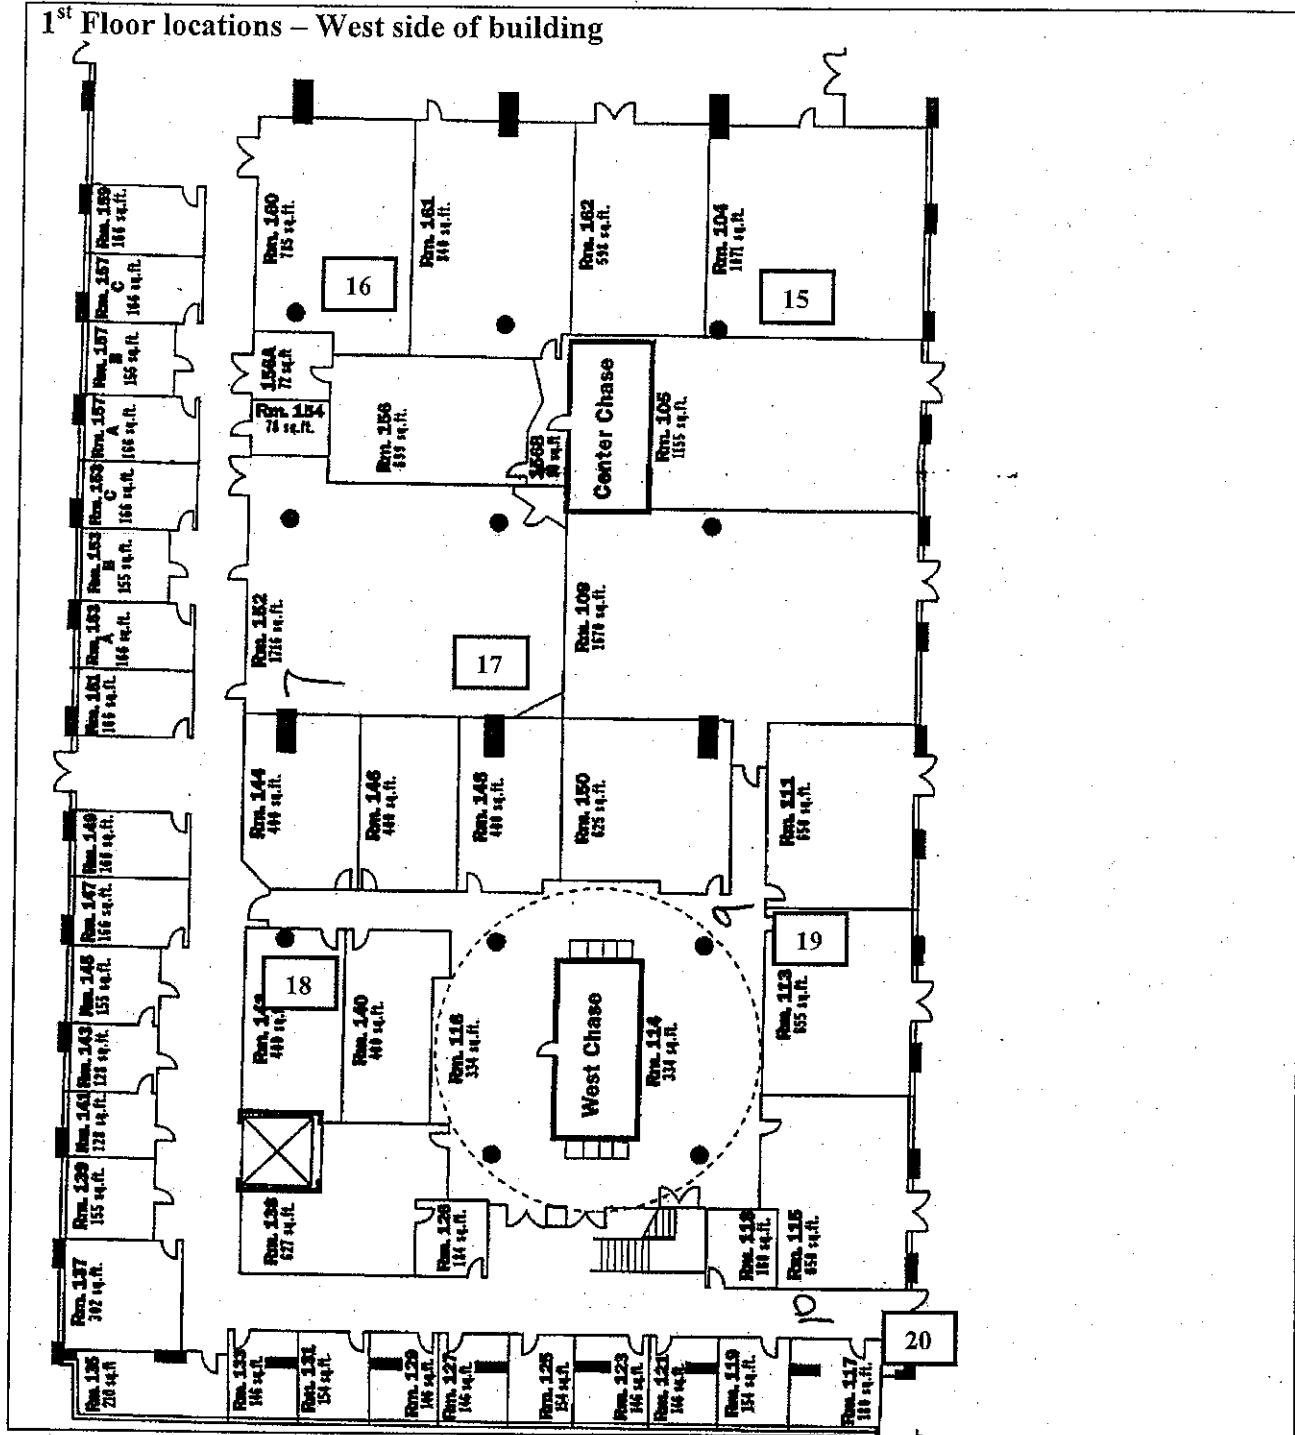

Basement locations

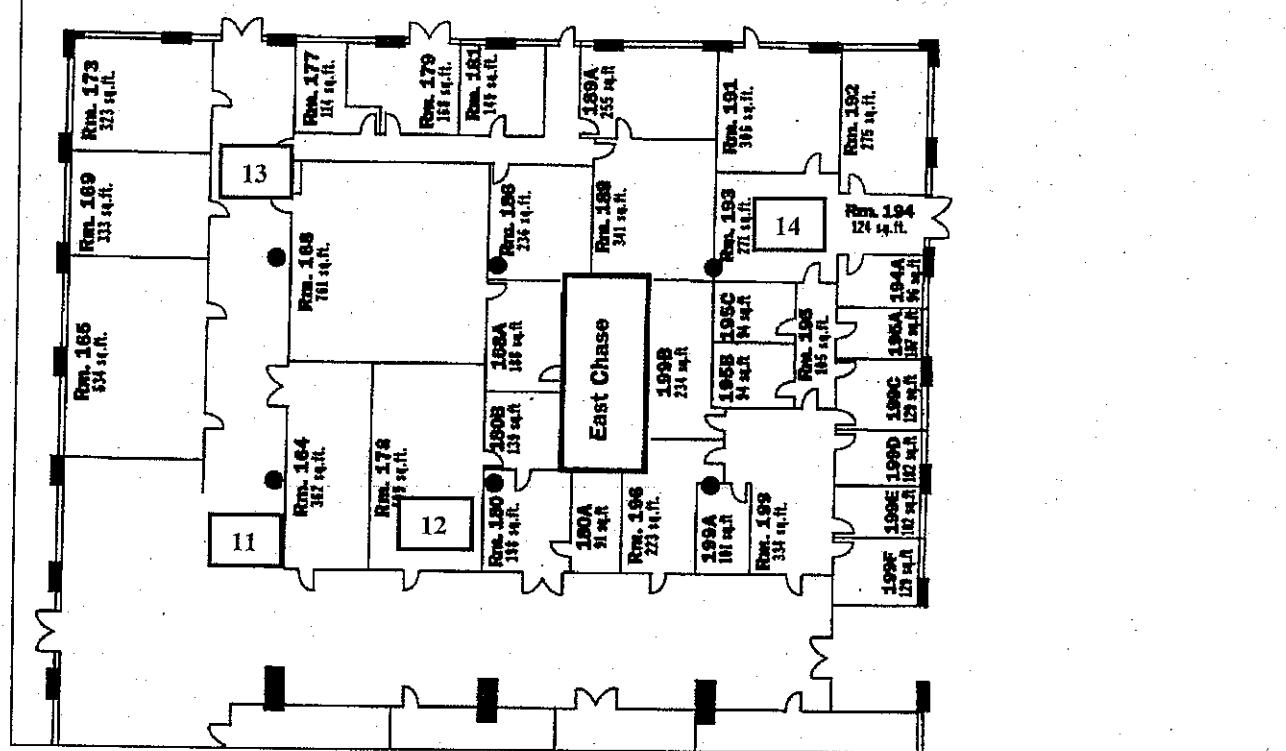

Jack Baskin Engineering Building

Basement
7-99

1st Floor locations – West side of building

1st Floor locations – East side of building

6.0 Conclusions

- **Vibration:**
The basement meets the LEO specification except in sites 7, 8 and 9 vertically and 10 in the North-South direction.
The 1st floor does not meet the specification anywhere.
- **EMI:**
All locations meet the specifications except for sites 7, 9, 10 and 19. Fields of 9 mGauss RMS were measured on the floor of room 104 (Site 15) and 7 mGauss RMS on the floor of room 113 (Site 19)
- **Acoustic:**
Sites 3, 4, 5, 6, 7 and 18 meet the LEO acoustical specifications. All other rooms do not meet them.
- **Roof fans:**
The fan #FS66 should be fixed so that it is floating freely in all 3 directions on its isolators.

7.0 Recommendations

- A cinderblock room should be built to accommodate the SEM.
- The SEM pumps and transformer should be placed in a chase outside this room.
